

packages/graph-core/src/types.ts

Kind: added · Baseline: a9c34bfb03fe · Target: NovaDiff · Generated: 2026-05-20T05:29:44.024Z

Overview

A new file `packages/graph-core/src/types.ts` (204 added lines) introduces a comprehensive type system for the NovaDiff knowledge graph, defining nodes, edges, layers, projects, and plugin interfaces.

Key changes

- **Node taxonomy** – `export type NodeType` (lines 2-7) lists 21 node kinds (code, non-code, domain, knowledge).
- **Edge taxonomy** – `export type EdgeType` (lines 10-19) lists 35 edge kinds across 8 categories.
- **Metadata interfaces** – `KnowledgeMeta` (lines 22-27) and `DomainMeta` (lines 30-35) add optional fields for knowledge and domain nodes.
- **Core graph shapes** – `GraphNode` (lines 39-53) now includes `layerId`, `domainMeta`, `knowledgeMeta`; `GraphEdge` (lines 56-63) adds `direction` and `weight`.
- **Project & analysis** – `ProjectMeta` (lines 83-90), `KnowledgeGraph` (lines 93-101), `AnalysisMeta` (lines 110-116), `ProjectConfig` (lines 118-122) formalize persistence and configuration.
- **Plugin contracts** – `StructuralAnalysis` (lines 171-183) now includes optional structural data (sections, definitions, services, etc.); `AnalyzerPlugin` (lines 197-204) exposes `analyzeFile` and optional `resolveImports`, `extractCallGraph`, `extractReferences`.

Impact

- Modules must import types from the new file; missing imports will cause compile errors.
- Plugins implementing `AnalyzerPlugin` must satisfy the expanded interface; optional methods may be omitted.
- The file adds ~200 lines of type definitions; runtime impact is negligible, but TypeScript compilation time increases modestly.

Risks & follow-ups

- Verify that no other module defines `NodeType` or `EdgeType` to avoid name collisions.
- Update documentation (README, type docs) to reflect the new taxonomy.
- Add unit tests covering all `NodeType` and `EdgeType` values to guard against regressions.
