

packages/graph-core/tsconfig.json

Kind: added · Baseline: a9c34bfb03fe · Target: NovaDiff · Generated: 2026-05-20T05:05:24.353Z

Overview

A new `tsconfig.json` file was added to `packages/graph-core` (lines 1-19). It configures TypeScript to compile the package with modern ECMAScript features and strict type-checking.

Key changes

- **File added:** `packages/graph-core/tsconfig.json` (lines 1-19).
- **Target & module:** `target: "ES2022"` and `module: "ESNext"` enable native ES2022 syntax and modern module handling.
- **Library:** `lib: ["ES2022"]` limits globals to the ES2022 API set.
- **Resolution:** `moduleResolution: "bundler"` aligns with the build system's bundler strategy.
- **Strictness:** `strict: true`, `esModuleInterop: true`, `skipLibCheck: true`, `forceConsistentCasingInFileNames: true` enforce robust type safety.
- **Output:** `outDir: "dist"`, `rootDir: "src"` set the build output structure.
- **Declarations:** `declaration: true`, `declarationMap: true` generate `.d.ts` files for consumers.
- **JSON support:** `resolveJsonModule: true` allows importing JSON modules.
- **Source maps:** `sourceMap: true` aids debugging.
- **Include:** `include: ["src"]` limits compilation to source files.

Impact

- **Build pipeline:** The new config will be used by `tsc` when compiling `graph-core`; unknown from the available diff/scan evidence whether the build script references it.
- **Runtime compatibility:** unknown from the available diff/scan evidence.
- **Type safety:** strict mode and declaration generation are enabled, which may surface type errors in existing code.
- **Module resolution:** `moduleResolution` set to `bundler` may affect how external modules are resolved; verify that third-party imports still resolve correctly.

Risks & follow-ups

- **Build failures:** run `npm run build:graph-core` to confirm the new tsconfig compiles without errors.
- **Test coverage:** execute the package's unit tests to catch any runtime regressions due to the ES2022 target.
- **Compatibility:** verify that downstream projects consuming `graph-core` can handle the new module format and ES2022 features.

- **Documentation:** update any build or developer docs that reference the previous TypeScript configuration.
