

packages/graph-view/package.json

Kind: added · Baseline: a9c34bfb03fe · Target: NovaDiff · Generated: 2026-05-20T05:02:10.559Z

Overview

A new `packages/graph-view/package.json` (added lines R1-47) introduces the `@novadiff/graph-view` library. It is marked `private`, uses `"type": "module"`, and exports its public API from `./src/index.ts` and `./src/index.css` (lines 6-9).

Key changes

- **Package metadata** – `name`, `private`, `version`, and `type` are set (lines 2-5).
- **Exports** – `"."`: `"./src/index.ts"` and `"./styles.css"`: `"./src/index.css"` (lines 6-9).
- **Scripts** – `dev`, `build`, `build:demo`, `preview`, `test`, and `test:watch` invoke Vite, TypeScript, and Vitest (lines 10-17).
- **Dependencies** – includes a local link to `@novadiff/graph-core` (`file:../graph-core`) and libraries such as `@dagrejs/dagre`, `@xyflow/react`, `d3-force`, `elkjs`, and `graphology` (lines 18-34).
- **DevDependencies** – adds Tailwind, TypeScript, Vite, Vitest, and type definitions (lines 35-46).

Impact

- **Build** – The package requires running `tsc -b` followed by `vite build` (as per the `build` script).
- **Testing** – Vitest tests will execute in the context of this package (`test` and `test:watch` scripts).
- **Workspace** – The local dependency on `graph-core` (`file:../graph-core`) means the monorepo must expose both packages; otherwise resolution fails.
- **Import paths** – The `exports` field restricts consumers to import from `@novadiff/graph-view` or its sub-paths.

Risks & follow-ups

- **Missing workspace config** – If `packages/graph-view` is not listed in the monorepo workspace, installation will break.
- **Dependency conflicts** – Shared dependencies (e.g., React, TypeScript) may clash with root versions; verify compatibility.
- **Build failures** – Ensure `tsc` and Vite configurations are correct; run `npm run build` locally.
- **Test coverage** – Run `npm run test` to confirm that the new package's tests pass and coverage thresholds are met.
