

packages/graph-view/src/components/Breadcrumb.tsx

Kind: added · Baseline: a9c34bfb03fe · Target: NovaDiff · Generated: 2026-05-20T06:02:38.485Z

Overview

A new `Breadcrumb` component was added to `packages/graph-view/src/components/Breadcrumb.tsx` (lines R1-R44). It renders a breadcrumb bar in the top-left corner of the graph view, showing the current navigation level and allowing quick navigation back to the overview or to a deeper embed depth.

Key changes

- **Imports** (R1-R3) ``ts import { useDashboardStore } from "../store"; import { useI18n } from "../contexts/I18nContext"; import { PROJECT_WIDE_LAYER_ID, resolveActiveLayer } from "../utils/activeLayer";

```
- **State hooks** (R6-R11) ts const navigationLevel = useDashboardStore((s) =>
s.navigationLevel); const activeLayerId = useDashboardStore((s) => s.activeLayerId); const graph =
useDashboardStore((s) => s.graph); const navigateToOverview = useDashboardStore((s) =>
s.navigateToOverview); const enterNovaDiffEmbedDepth = useDashboardStore((s) =>
s.enterNovaDiffEmbedDepth); const { t } = useI18n(); - **Active-layer logic** (R13-R15) ts
const activeLayer = graph && activeLayerId ? resolveActiveLayer(graph, activeLayerId) : null; const
isProjectWide = activeLayerId === PROJECT_WIDE_LAYER_ID;
```

```
- `navigationLevel === "overview"` shows a badge with `t.breadcrumb.project`
```

Overview

```
`.
```

```
- `navigationLevel === "layer-detail"` shows a button that toggles between overview and embed
depth, displays the active layer name (or `t.layer.defaultName`), and a back-arrow hint
(`t.breadcrumb.escBack`).
```

```
- **Export** (R5) - `export default function Breadcrumb() { ... }`.
```

Impact

```
- **UI**: Adds a breadcrumb bar that appears in the top-left corner, improving navigation
visibility.
```

```
- **Store subscriptions**: The component subscribes to several slices of `useDashboardStore`;
frequent changes may trigger re-renders.
```

```
- **Internationalization**: Requires the `t.breadcrumb.*` keys and `t.layer.defaultName` to exist;
missing keys will render `undefined`.
```

```
- **Styling**: Uses Tailwind classes; global style changes may affect appearance.
```

```
- **Testing**: No tests are present in the diff; integration tests should cover visibility and
click behavior.
```

Risks & follow-ups

- **Missing i18n keys** – verify that all ``t.breadcrumb.*`` and ``t.layer.defaultName`` keys exist in locale files.
- **Store shape** – ensure ``useDashboardStore`` exposes ``navigationLevel``, ``activeLayerId``, ``graph``, ``navigateTo``

Overview

```, and ``enterNovaDiffEmbedDepth``; otherwise the component will crash.

- **Active-layer resolution** – confirm that ``resolveActiveLayer`` correctly handles ``null`` or ``undefined`` ``graph`/`activeLayerId`` cases.
- **Performance** – monitor re-render frequency when the dashboard state changes; consider memoizing derived values if needed.
