

packages/graph-view/src/index.css

Kind: added · Baseline: a9c34bfb03fe · Target: NovaDiff · Generated: 2026-05-20T05:20:03.959Z

Overview

A new file `packages/graph-view/src/index.css` (lines 1-484) has been added.

It imports Tailwind, declares a `@theme` block with many CSS custom properties, and scopes a wide range of base, component, and utility styles for the Graph View UI.

Key changes

- `@import "tailwindcss";` – pulls Tailwind utilities into the bundle. (R1)
- `@theme { ... }` – defines ~70 CSS variables for colors, typography, glass effects, scrollbars, and node-type hues. (R3-89)
- Global styles for `html`, `body`, `#root`, and the `.novadiff-graph-explorer-root/.novadiff-graph-theme-host` containers, isolating the graph view from the host app. (R93-110)
- Utility classes such as `.glass`, `.glass-heavy`, `.kbd`, and animation helpers (`.animate-fade-slide-in`, `.animate-slide-up`, `.animate-accent-pulse`). (R135-217)
- React-Flow overrides (`.react-flow__background`, `.react-flow__edge-path`, etc.) to match the new theme. (R266-290)
- Light/dark theme overrides via `[data-theme="light"]` and `[data-theme="dark"]`. (R316-337)
- Modal and button styles for the “Explain Code” feature, including keyframes for a pulsing effect. (R339-480)

Impact

- **Styling scope** – selectors are scoped to the graph view containers, so they should not repaint the entire NovaDiff app.
- **Maintainability** – centralizing theme variables in `@theme` simplifies future color or typography updates.
- **Compatibility** – the Tailwind import must resolve in the build pipeline; missing it will break the stylesheet.
- **Performance** – the stylesheet size increases with the added file; it is only loaded when the graph view is rendered. (unknown from the diff)

Risks & follow-ups

- **CSS conflicts** – generic selectors such as `.novadiff-graph-embed` or `.react-flow__background` could clash with existing global styles.
- **Build integration** – verify that the Tailwind import resolves correctly in the current build config.
- **Visual regressions** – run graph-view smoke tests to confirm node colors, borders, and glass effects render as intended. (unknown from the diff)

- **Accessibility** – contrast ratios for the new color variables, especially in light mode, are not verified. (unknown from the diff)
