

packages/graph-view/src/locales/en.ts

Kind: added · Baseline: a9c34bfb03fe · Target: NovaDiff · Generated: 2026-05-20T05:34:31.026Z

Overview

A new locale file `packages/graph-view/src/locales/en.ts` has been added. It defines the English string bundle `en` (exported at line 1) and exports it as the module's default export (line 272).

Key changes

- **File creation** – `packages/graph-view/src/locales/en.ts` now exists.
- **Exported object** – `export const en = { ... }` introduces a comprehensive set of UI labels, tooltips, and messages (see diff lines 1-270).
- **Default export** – `export default en;` (line 272) makes the bundle available via `import en from './locales/en'`.
- **No other modules touched** – the diff shows only this new file; no imports or references were added elsewhere.

Impact

- The bundle is self-contained; importing it will not cause runtime errors unless the import path is incorrect.
- It centralizes English strings, simplifying future updates.
- Existing code that does not import `en` remains unaffected.

Risks & follow-ups

- **Unused file** – Verify that the build process includes this file; otherwise it may be omitted from the bundle.
- **Missing imports** – Ensure components that need English strings import `en` from the correct path.
- **Duplicate keys** – The large object contains many nested keys; confirm that no accidental key collisions exist with other locale files.
- **Build size** – Adding a large string bundle could increase bundle size; monitor the production build size to confirm it stays within acceptable limits.
