Overview

A new module `packages/graph-view/src/locales/index.ts` (lines R1-R32) introduces locale definitions and lookup utilities.

Key changes

- **Imports:** `en`, `zh`, `zhTW`, `ja`, `ko` (R1-R5).
- **Types:** `LocaleKey` enumerates supported keys (R7); `Locale` is inferred from `en` (R8).
- **Locale map:** `locales` records each key to its locale object (R10-R16).
- **Lookup:** `getLocale(key)` returns the locale or falls back to `en` (R18-R20).
- **Normalization:** `resolveLocaleKey(lang)` normalizes language strings to a `LocaleKey` (R22-R29).
- **Re-exports:** individual locales are re-exported, aliasing `zhTW` as `"zh-TW"` (R32).

Impact

- Centralizes locale handling, simplifying future additions.
- Provides type safety for locale keys.
- O(1) lookup via the `locales` map; normalization uses lightweight string ops.

Risks & follow-ups

- Verify that the `zhTW` alias correctly resolves to `"zh-TW"` in imports and consumers.
- Add unit tests for `resolveLocaleKey` covering edge cases (e.g., `"zh-cn"`, `"ja-JP"`).
- Ensure `getLocale`'s fallback to `en` behaves as expected when an unknown key is passed.
- Check for potential circular dependencies introduced by re-exporting locale modules.
