Overview

`packages/graph-view/src/main.tsx` is a new entry point that bootstraps the React application. The file adds imports for `StrictMode` (react), `createRoot` (react-dom/client), a local stylesheet, and the root `App` component. It then creates a React 18 root on the DOM element with id `root` and renders `<App />` inside a `<StrictMode>` wrapper.

Key changes

- **Imports added** (lines 1-4):

```
``ts import { StrictMode } from "react"; import { createRoot } from "react-dom/client"; import "./index.css"; import App from "./App";
```

– ****Root creation**** (line 6): `ts createRoot(document.getElementById("root")!).render(``` uses React 18's `createRoot` API and a non-null assertion on the element.

- **StrictMode wrapper** (lines 7-9):

```
``tsx
```

```
``### Impact
```

- The app mounts correctly under React 18, enabling the new root API.
- The use of `<StrictMode>` activates additional development checks.
- The non-null assertion guarantees that the element exists at runtime, otherwise a runtime error will occur.

Risks & follow-ups

- **Missing root element:** `document.getElementById("root")!` will throw if `<div id="root">` `</div>` is absent in `index.html`.
- **Missing CSS:** Importing `./index.css` will fail if the file is not present or not bundled.
- **Duplicate root creation:** If another script also calls `createRoot` on the same element, conflicts may arise.
- **Linting & build:** Run `npm run lint`, `npm test`, and `npm run build` to confirm no TypeScript or bundler errors.
