

packages/graph-view/src/themes/index.ts

Kind: added · Baseline: a9c34bfb03fe · Target: NovaDiff · Generated: 2026-05-20T05:38:00.312Z

Overview

A new module `packages/graph-view/src/themes/index.ts` has been added. It consolidates exports from several internal files into a single public surface.

Key changes

- `export { ThemeProvider, useTheme } from "./ThemeContext.tsx";` – re-exports the context provider and hook.
- `export { PRESETS, getPreset, getAccent } from "./presets.ts";` – exposes preset data and helper functions.
- `export { applyTheme } from "./theme-engine.ts";` – provides the runtime theme application logic.
- `export type { HeadingFont, PresetId, ThemeConfig, ThemePreset, AccentSwatch } from "./types.ts";` – re-exports core type definitions.
- `export { DEFAULT_THEME_CONFIG } from "./types.ts";` – exposes the default configuration object.

These lines are added at the top of the file (diff lines 1-5).

Impact

- **Correctness:** Consumers can now import theme utilities directly from `packages/graph-view/src/themes`.
- **Maintainability:** Centralizes theme exports, reducing import churn across the codebase.
- **Compatibility:** No breaking changes are introduced; the new file only adds exports.
- **Observability:** The module only re-exports existing functionality, so no new runtime behavior is added.

Risks & follow-ups

- Verify that `ThemeContext.tsx`, `presets.ts`, `theme-engine.ts`, and `types.ts` compile and are included in the build (unknown from the available diff/scan evidence).
- Ensure the new exports do not shadow existing symbols in other modules.
- Run the existing test suite to confirm that no tests fail due to the added public surface (unknown from the available diff/scan evidence).
- Check that the documentation generator picks up the new exports for API docs.
