

packages/graph-view/tsconfig.app.json

Kind: added · Baseline: a9c34bfb03fe · Target: NovaDiff · Generated: 2026-05-20T05:02:39.345Z

Overview

A new TypeScript configuration file `packages/graph-view/tsconfig.app.json` was added (lines 1-24). It defines compiler options and source inclusion for the Graph View application.

Key changes

- `compilerOptions` target **ES2020** with `module: "ESNext"` and `moduleResolution: "bundler"` (diff lines 2-4).
- Strict mode enabled (`strict: true`) and lint flags: `noUnusedLocals` , `noUnusedParameters` , `noFallthroughCasesInSwitch` , `noUncheckedSideEffectImports` (diff lines 17-21).
- `useDefineForClassFields: true` , `skipLibCheck: true` , and `jsx: "react-jsx"` (diff lines 5-6, 15).
- Incremental build info stored at `./node_modules/.tmp/tsconfig.app.tsBuildInfoFile` (`tsBuildInfoFile` line 3).
- `noEmit: true` indicates this config is for type-checking only (diff line 14).
- Source files included via `"include": ["src"]` (diff line 23).

Impact

- The configuration enables stricter type-checking for Graph View code.
- `noEmit: true` means the file is not used for emitting JavaScript; a separate build config must handle bundling.
- The presence of `noUncheckedSideEffectImports` suggests a recent TypeScript version is required, though the exact version compatibility is unknown from the diff.

Risks & follow-ups

- Verify that build scripts (e.g., `tsc --project packages/graph-view/tsconfig.app.json`) reference this file.
- Ensure the `./node_modules/.tmp/` directory is writable during CI to avoid build failures.
- Confirm the repository's TypeScript version supports all enabled flags, especially `noUncheckedSideEffectImports` .
