

packages/graph-view/tsconfig.json

Kind: added · Baseline: a9c34bfb03fe · Target: NovaDiff · Generated: 2026-05-20T05:03:06.910Z

Overview

A new TypeScript configuration file has been added at `packages/graph-view/tsconfig.json`. The file contains an empty `"files"` array and a single reference to `./tsconfig.app.json` (lines 1-4 of the diff).

Key changes

- **File added:** `packages/graph-view/tsconfig.json` ```json { "files": [], "references": [{ "path": "./tsconfig.app.json" }] }

Impact

- The file enables project references for the `graph-view` package, allowing isolated compilation.
- With an empty `"files"` array, the compiler will include all files under the package root unless excluded elsewhere.
- The reference to `tsconfig.app.json` introduces a dependency that must exist and be correctly configured; otherwise the build will fail.

Risks & follow-ups

- **Missing `tsconfig.app.json`:** Verify that the referenced file exists in `packages/graph-view`.
- **Build failures:** Run `tsc -b packages/graph-view` to confirm the reference chain resolves.
- **Duplicate references:** Ensure no other tsconfig files inadvertently reference `graph-view` in a conflicting way.
- **Performance impact:** Monitor compile times; the empty `"files"` array could increase the number of files processed.
