

packages/graph-view/vite.config.demo.ts

Kind: added · Baseline: a9c34bfb03fe · Target: NovaDiff · Generated: 2026-05-20T05:03:40.822Z

Overview

A new Vite configuration file `packages/graph-view/vite.config.demo.ts` (lines 1-49) has been added to support a demo build of the graph view.

Key changes

- **Imports** added:
 - `defineConfig` from `vite` (R1)
 - `react` from `@vitejs/plugin-react` (R2)
 - `tailwindcss` from `@tailwindcss/vite` (R3)
 - `path` from `path` (R4)
- **Base path** set to `"/demo/"` (R7) to serve assets under `/demo/`.
- **Aliases** map `@novadiff/graph-core/*` to compiled `dist/*.js` files (R11-R13).
- **Environment** variable `import.meta.env.VITE_DEMO_MODE` set to `"true"` (R18).
- **Chunking** logic splits `node_modules` into `react-vendor`, `xyflow`, `graph-layout`, and `markdown` bundles (R24-R41).
- **Plugins** registered: `react()` and `tailwindcss()` (R48).

Impact

- The demo build can resolve core modules via the new aliases.
- `VITE_DEMO_MODE` flag is available to the application code.
- Chunking may reduce bundle size for the demo, but the exact impact is unknown from the diff.

Risks & follow-ups

- Verify that the `path.resolve` aliases point to the correct build outputs; a mismatch will break module resolution.
- Ensure the regexes in `manualChunks` cover all intended `node_modules`; missing patterns could lead to oversized bundles.
- Test that the application consumes `VITE_DEMO_MODE` as expected.
- Confirm that the `/demo/` base path does not conflict with production routes.
