

Overview

A new module `src/app/docsQuality.ts` adds utilities for creating markdown summaries, prompt contexts, and confidence badges that feed into release-overview documents.

Key changes

- **Imports** – pulls `EvidenceBadge`, `FileChange`, `RiskSignal`, `SelectionIndexEntry`, and `SummaryIndexEntry` from `./types`.
- **Helpers** – `uniqStrings` (lines 9-21) removes duplicates and limits results; `compactText` (lines 24-30) normalises and truncates long strings.
- **Anchor generator** – `relPathAnchorId` (lines 32-38) turns a relative path into a slug suitable for markdown anchors.
- **Prompt context builders** –
 - `buildSummaryPromptContext` (lines 41-58) formats up to ten summary entries for LLM prompts.
 - `buildRiskPromptContext` (lines 59-74) formats up to fourteen risk signals.
- **Badge derivation** – `deriveConfidenceBadges` (lines 75-142) produces evidence-backed badges based on summary coverage, risk severity, and selection docs.
- **Markdown generator** – ``buildRelease`

Overview

`Markdown`` (lines 143-247) assembles a full release-overview document, including tables of signals, confidence badges, top files, risk lists, and summary rollups.

Impact

- Exposes a new public API; consumers must import the correct types.
- Centralises markdown logic, reducing duplication across the codebase.
- Operations run linearly over input arrays, suitable for typical dataset sizes.
- No breaking changes to existing modules; only new exports are added.

Risks & follow-ups

- **Testing** – verify helper functions handle edge cases (empty arrays, very long strings).
- **Type alignment** – ensure `EvidenceBadge` and related types are exported from `./types` and match the expected shape.
- **Markdown rendering** – confirm that the generated markdown displays correctly in downstream tools such as GitHub PR comments.
- **Integration** – callers of ``buildRelease`

Overview

Markdown` must provide all required arguments; missing data could trigger runtime errors.
