

## src/app/gitTypes.ts

Kind: added · Baseline: a9c34bfb03fe · Target: NovaDiff · Generated: 2026-05-20T04:43:27.664Z

### Overview

A new file `src/app/gitTypes.ts` has been added. It declares a set of TypeScript interfaces that model Git tooling status, GitHub authentication, repository and pull-request summaries, local repo matching, blame information, status files, and publish-related payloads and results.

### Key changes

- **GitToolingStatus** – lines 1-6 (R1-R6) ``ts export interface GitToolingStatus { git: { gitAvailable: boolean; gitVersion: string | null; gitError: string | null; }; gh: GithubAuthStatus; }

```
- **GithubRepoSummary** – lines 19-28 (R19-R28)
- **GithubPullRequestSummary** – lines 30-41 (R30-R41)
- **LocalRepoMatch** – lines 43-47 (R43-R47)
- **GitBlameOwner** – lines 50-54 (R50-R54)
- **GitStatusFile** – lines 64-68 (R64-R68)
- **GitRepoStatus** – lines 71-82 (R71-R82)
- **PrCompareRoots** – lines 84-89 (R84-R89)
- **PublishPreview** – lines 91-102 (R91-R102)
- **PublishExecuteResult** – lines 104-110 (R104-R110)
- **PublishExecutePayload** – lines 113-125 (R113-R125)
```

#### ### Impact

- **Type safety** – modules that consume Git or GitHub data can import these interfaces, providing compile-time guarantees about the shape of the data.
- **Documentation** – the interfaces serve as living documentation for the data structures used throughout the application.
- **Runtime** – the change adds only type declarations; no executable code is introduced, so existing JavaScript behavior is unaffected.

#### ### Risks & follow-ups

- **Import consistency** – verify that modules import the correct path (``src/app/gitTypes``) and that no duplicate definitions exist.
- **Build pipeline** – run ``npm run lint``, ``npm test``, and ``npm run build`` to ensure the new file does not introduce type errors.
- **Documentation** – update any README or developer docs that reference GitHub or Git data structures to point to these new interfaces.
