

src/app/novadiffPaths.ts

Kind: added · Baseline: a9c34bfb03fe · Target: NovaDiff · Generated: 2026-05-20T04:45:59.460Z

Overview

A new module `src/app/novadiffPaths.ts` defines a constant and a helper function for paths reserved for Novadiff documentation. The comment on line 1 notes that the value must match `NOVADIFF_DOCS_DIR` in `cli/src/main.rs`.

Key changes

- **Line 2** – `export const NOVADIFF_DOCS_REL = "novadiff-docs";`
- **Line 4** – `export function isNovadiffDocsReservedPath(rel: string | null | undefined): boolean`
- **Lines 8-9** – The function normalises backslashes to forward slashes and returns `true` if the path equals `NOVADIFF_DOCS_REL` or starts with `novadiff-docs/`.
- **Lines 5-7** – Handles `null` or empty strings by returning `false`.

Impact

- **Correctness** – Centralises the reserved-docs path, reducing duplicated string literals.
- **Maintainability** – Future changes to the docs directory require editing only this file.
- **Compatibility** – Adds exports without altering existing APIs.
- **Observability** – The function can be unit-tested to confirm alignment with the Rust constant.

Risks & follow-ups

- Verify that `NOVADIFF_DOCS_REL` matches the Rust `NOVADIFF_DOCS_DIR` value; a mismatch will affect routing.
- Add unit tests for `isNovadiffDocsReservedPath` covering `null`, empty, relative, and absolute paths.
- Ensure linting and TypeScript compilation succeed with the new file.
