

src/app/pathDisplay.ts

Kind: added · Baseline: a9c34bfb03fe · Target: NovaDiff · Generated: 2026-05-20T04:46:27.000Z

Overview

A new module `src/app/pathDisplay.ts` adds the exported helper `pathDisplayLabel` (lines 2-15). It trims whitespace, normalizes slashes, and returns only the last one or two path segments, never the full absolute path.

Key changes

- **Export:** `export function pathDisplayLabel(absPath: string): string` (lines 2-15).
- **Sanitization:** trims the input and returns an empty string for empty or whitespace-only paths (lines 3-6).
- **Normalization:** replaces backslashes with forward slashes, splits on `/`, and removes empty segments (line 7).
- **Segment selection:**
 - If no segments remain, returns the trimmed input (lines 8-10).
 - If one segment exists, returns that segment (lines 11-13).
 - Otherwise returns the last two segments joined by `/` (lines 14-15).
- **Documentation comment:** clarifies that the label is for onboarding UI and should never expose full paths (line 1).

Impact

- **Security:** The function never returns a full absolute path, mitigating accidental exposure of filesystem structure.
- **Centralization:** Path-label logic is now in a single, reusable utility.
- **No API changes:** Existing modules are unaffected; only new imports are required.

Risks & follow-ups

- **Edge-case handling:** Behavior with root paths (`/`, `C:\\`), UNC paths, or paths with multiple consecutive slashes is unknown from the available diff/scan evidence.
- **Integration:** Verify that UI components previously constructing path labels now import and use `pathDisplayLabel`.
- **Testing:** Add unit tests for empty, single-segment, multi-segment, and mixed-slash inputs.
- **Documentation:** Update onboarding or security docs to reference the new helper and its safety guarantees.
