

src/components/GitBlamePanel.tsx

Kind: added · Baseline: a9c34bfb03fe · Target: NovaDiff · Generated: 2026-05-20T04:54:23.271Z

Overview

A new React component `GitBlamePanel` is added at `src/components/GitBlamePanel.tsx` (lines 1-159). It renders a panel that lists files from a workspace snapshot, fetches Git blame for a selected file, and displays line-by-line author attribution.

Key changes

- **Imports** (R1-R4): React hooks (`useCallback`, `useEffect`, `useMemo`, `useState`), icons (`FileText`, `Loader2`, `Search`), and types `GitBlameAtRefResult` and `WorkspaceCommitSnapshot`.
- **Props interface** (R6-R10): `repoRoot: string`, `commit: WorkspaceCommitSnapshot`, `onClose: () => void`.
- **Component** (R12): Uses `window.electronAPI` to call
 - `workspaceSnapshotListFiles` in a `useEffect` (lines 23-34) to populate `files`.
 - `gitBlameAtRef` and `workspaceSnapshotReadFile` in `loadBlame` (lines 44-70) to fetch blame and file content concurrently.
- **UI**: searchable file list with loading spinner (lines 90-118), blame view showing owners, error messages, and a preformatted code block with line numbers, author badges, and code (lines 121-155). Close button triggers `onClose` (lines 81-83).

Impact

- The component depends on `window.electronAPI` methods; missing or mis-typed API names will surface at runtime.
- Rendering large files may strain the browser; the diff does not indicate any safeguards.
- CSS classes (`git-blame-panel`, `git-blame-layout`, etc.) are added; potential clashes with existing styles are unknown from the diff.

Risks & follow-ups

- Verify that `workspaceSnapshotListFiles`, `gitBlameAtRef`, and `workspaceSnapshotReadFile` exist and return the expected shapes.
- Test with large snapshots to ensure `fileContent.split(/\r?\n/)` and rendering do not crash.
- Confirm that the close button is keyboard-accessible and that icons with `aria-hidden` do not impede screen readers.
