

src/components/launch/LaunchBoot.tsx

Kind: added · Baseline: a9c34bfb03fe · Target: NovaDiff · Generated: 2026-05-20T05:14:11.335Z

Overview

A new component `src/components/launch/LaunchBoot.tsx` (lines 1-216) drives the NovaDiff startup animation. It renders a dialog with a logo, typewriter-style text, a progress bar, and a skip prompt, and it calls a single `onExitComplete` callback when the exit fade finishes.

Key changes

- **Imports** (lines 1-9): React hooks, `appMark` icon, launch constants (`LAUNCH_EXIT_FADE_MS` , `LAUNCH_HOLD_MS` , `LAUNCH_HOLD_SKIP_AFTER_MS`), `usePrefersReducedMotion` , and `TypewriterText` .
- **Props interface** (lines 13-15): `LaunchBootProps` exposes `onExitComplete: () => void` .
- **Component** (lines 17-216):
 - State: `step` , `progress` , `canSkip` ; refs: `exitCalledRef` , `onExitRef` .
 - `useEffect` chains progress through steps (`intro` → `title` → `tagline` → `subtitle` → `continue` → `hold` → `exit`) with timers, respecting reduced-motion preference.
 - Skip logic: after `LAUNCH_HOLD_SKIP_AFTER_MS` the user may press Enter/Space or click to trigger `beginExit` .
 - `onExitComplete` is invoked once after the exit fade (`LAUNCH_EXIT_FADE_MS`).
- **Render**: dialog with `role="dialog"` , `aria-modal="true"` , logo image, typewriter text for each step, progress bar, and a skip prompt that appears after the "continue" step.

Impact

- Adds a dedicated launch sequence component; no existing files are altered.
- Encapsulates animation logic, simplifying future maintenance.
- Introduces timers and state updates; startup performance impact is minimal.
- Provides reduced-motion support via `usePrefersReducedMotion` and accessible dialog attributes.

Risks & follow-ups

- Verify `onExitComplete` is called exactly once; `exitCalledRef` prevents double calls.
- Ensure all timers are cleared on unmount (cleanup functions are present in each `useEffect`).
- Confirm skip behavior works for both keyboard (Enter/Space) and mouse click when `canSkip` is true.
- Test reduced-motion mode to ensure the animation is bypassed and the UI remains usable.
