

src/components/launch/launch.css

Kind: added · Baseline: a9c34bfb03fe · Target: NovaDiff · Generated: 2026-05-20T05:15:44.937Z

Overview

A new stylesheet `src/components/launch/launch.css` (added 531 lines, range R1-531) introduces a TRON-inspired launch overlay. The diff shows the addition of a comment header and a set of new classes such as `.launch-boot`, `.launch-boot-grid`, `.launch-boot-scan`, `.launch-boot-frame`, and `.launch-boot-logo-ring`, along with modifiers `.is-exiting` and `.is-hold`.

Key changes

- **Component styles** – new selectors for the overlay, grid, scan line, frame, and logo ring.
- **Keyframes** – `launch-continue-in`, `launch-grid-in`, `launch-scan-sweep`, `launch-frame-in`, `launch-logo-pulse`, and `typewriter-blink`.
- **Panel transitions** – `.app-shell.is-revealing .launch-panel--*` use `launch-fly-*` animations for chrome, side, main, and insights panels.
- **Sidebar brand** – `.sidebar.sidebar--launch .sidebar-brand` and `.sidebar-feature` receive `launch-brand-in` and `launch-chip-in` animations with staggered delays (0.35s, 0.44s, etc.).
- **Reduced-motion support** – a media query disables all animations and forces opacity to 1 for the launch panel when `prefers-reduced-motion` is active.

Impact

- **UI/UX** – provides a fully animated launch experience visible only during app start; runtime impact is limited to that window.
- **Maintainability** – styles are scoped to the `launch` namespace, reducing global CSS bleed.
- **Performance** – unknown from the diff; the file contains many `transform`, `filter`, and `box-shadow` rules that may increase GPU load during launch.
- **Compatibility** – uses modern CSS features (`color-mix`, `inset`, `mask-image`); fallback may be needed for older browsers.

Risks & follow-ups

- **Browser support** – verify `color-mix` and `mask-image` work in target browsers; provide fallbacks if necessary.
- **Reduced-motion handling** – ensure the media query correctly overrides animations and that the launch panel remains visible.
- **Animation timing** – confirm that staggered delays align with the overall launch flow.
- **CSS size** – the file is ~531 lines; monitor bundle size impact and consider tree-shaking if unused in production builds.
