

src/components/onboarding/WelcomeScreen.tsx

Kind: added · Baseline: a9c34bfb03fe · Target: NovaDiff · Generated: 2026-05-20T05:09:29.737Z

Overview

A new onboarding screen component `WelcomeScreen` has been added to `src/components/onboarding/WelcomeScreen.tsx`. It introduces a full GitHub integration flow with CLI detection, device-code authentication, and a local-only fallback.

Key changes

- **Imports:** React hooks (`useCallback`, `useEffect`, `useState`) and lucide-react icons (`Copy`, `Download`, `ExternalLink`, `FolderOpen`, `Loader2`, `User`) are added at the top of the file.
- **Props interface** (`WelcomeScreenProps`, lines 5-10): defines optional `cachedGitUser`, and callbacks `onComplete` and `onLocalOnly`.
- **Component implementation** (`WelcomeScreen`, lines 11-420):
 - State variables for loading, users, errors, selected user, auth flow, GitHub CLI status, install logs, etc.
 - `useCallback` helpers for `loadGhStatus`, `refresh`, `installGh`, `startAuth`, `copyCode`, `confirmUser`.
 - `useEffect` hooks to load GitHub status, refresh user list, and subscribe to auth/install progress events.
 - Render logic for CLI detection, sign-in flow, device-code copy, user list, and a local-only button.

Impact

- **API dependencies:** Relies on `window.electronAPI` methods (`githubGhStatus`, `githubDetectedUsers`, `githubGhInstall`, `githubStartAuth`, etc.). Missing or changed APIs will break the component.
- **Performance:** Frequent state updates during auth/install progress may affect rendering; monitor for unnecessary re-renders.
- **Accessibility & styling:** New UI elements use `aria-hidden` and custom classes; ensure they integrate with existing design system.
- **Testing:** Requires new unit and integration tests for the component and its API interactions.

Risks & follow-ups

- **API availability:** Confirm that all `window.electronAPI` methods exist and match the expected signatures.
- **Event listener cleanup:** `useEffect` returns callbacks from `api.onGithubAuthProgress` and `api.onGithubGhInstallProgress`; verify they are unsubscribed on unmount to avoid memory leaks.

- **Error handling:** The component surfaces raw error messages; ensure they are user-friendly and do not expose sensitive data.
- **UI regressions:** Run visual regression tests to verify that the new onboarding screen does not interfere with existing onboarding flows or layout.
