

src/components/ui/AnimatedOverlay.tsx

Kind: added · Baseline: a9c34bfb03fe · Target: NovaDiff · Generated: 2026-05-20T05:11:05.893Z

Overview

A new component `AnimatedOverlay` was added to `src/components/ui/AnimatedOverlay.tsx` (lines R1-79). It implements a modal overlay that respects the user's reduced-motion preference.

Key changes

- **Imports**
 - R1 added: `import { useEffect, useState } from "react";`
 - R2 added: `import { usePrefersReducedMotion } from "../app/usePrefersReducedMotion";`
- **Constant**
 - R4 added: `const CLOSE_MS = 300;` – delay used when closing the overlay.
- **Props interface** (`AnimatedOverlayProps`, R6-13)
 - `open: boolean`
 - `onClose: () => void`
 - `backdropClassName: string`
 - `panelClassName: string`
 - `labelledBy?: string`
 - `children: React.ReactNode`
- **Component logic** (`AnimatedOverlay`, R15-79)
 - State: `mounted` and `visible`.
 - First `useEffect` syncs mounting/visibility with `open` and reduced-motion settings, using `requestAnimationFrame` for the opening transition and `window.setTimeout` for the closing delay.
 - Second `useEffect` adds a global `keydown` listener that calls `onClose` when the Escape key is pressed.
 - Backdrop click handler triggers `onClose`.
 - Renders a `div` with `role="dialog"`, `aria-modal="true"`, optional `aria-labelledby`, and CSS classes `ui-overlay`, `ui-overlay-panel`, plus motion states `is-open` or `is-closing`.

Impact

- **Correctness** – The component mounts only when `open` is true and unmounts after the closing delay, respecting reduced-motion settings.
- **Maintainability** – A clear `AnimatedOverlayProps` interface and self-contained logic simplify future extensions.
- **Performance** – Uses `requestAnimationFrame` for visibility changes and a 300 ms timeout for closing, reducing layout thrashing.

- **Compatibility** – Relies on `window` and `document` APIs; may need SSR guards if used server-side.
- **Observability** – No side-effects beyond event listeners; listeners are cleaned up on unmount.

Risks & follow-ups

- Verify that `onClose` fires correctly on Escape key and backdrop click.
- Ensure `usePrefersReducedMotion` disables animation when appropriate.
- Test that the component unmounts cleanly after closing to avoid memory leaks.
- Confirm that the referenced CSS classes (`ui-overlay` , `ui-overlay-panel` , `is-open` , `is-closing`) exist and produce the intended visual effect.
