

src/components/ui/WorkspaceStage.tsx

Kind: added · Baseline: a9c34bfb03fe · Target: NovaDiff · Generated: 2026-05-20T05:11:57.815Z

Overview

A new UI component `WorkspaceStage` has been added under `src/components/ui/WorkspaceStage.tsx`. It introduces a lightweight wrapper that conditionally applies a CSS transition class based on the user's reduced-motion preference.

Key changes

- **New file** `src/components/ui/WorkspaceStage.tsx` with imports for `ReactNode` and `usePrefersReducedMotion`.
- **Interface** `WorkspaceStageProps` declares `pageKey: string` and `children: ReactNode`.
- **Component** `WorkspaceStage` renders a `<div>` hierarchy, applying the class `ui-view-enter` when motion is not reduced.
- **Key usage**: the inner `<div>` receives `key={pageKey}` to force remounts on page changes.
- **Export**: both the interface and the component are exported for external use.

Impact

- **UI behavior**: Adds a fade-in transition to workspace stages unless the user prefers reduced motion, improving accessibility.
- **Reusability**: The component can be dropped into any page that needs a consistent stage wrapper.
- **Performance**: Minimal overhead; only a single hook call and a conditional class name.
- **Compatibility**: No changes to existing components; purely additive.

Risks & follow-ups

- Verify that the CSS class `ui-view-enter` exists and behaves as intended.
- Ensure `pageKey` is unique per stage to avoid React key warnings.
- Test the reduced-motion toggle to confirm the transition is correctly suppressed.
- Confirm that the component is imported and used in the relevant pages; otherwise the new file remains unused.
