

src/components/ui/ui-transitions.css

Kind: added · Baseline: a9c34bfb03fe · Target: NovaDiff · Generated: 2026-05-20T05:12:41.223Z

Overview

A new stylesheet `src/components/ui/ui-transitions.css` (added lines R1-120) introduces CSS-only transition rules for overlays, panels, and view animations, with a media query for reduced-motion users.

Key changes

- **Overlay** – `.ui-overlay` (lines 3-6) starts with `opacity: 0` and a 0.28s transition. `.ui-overlay.is-open` (lines 8-10) sets `opacity: 1`. `.ui-overlay.is-closing` (lines 12-15) fades to `opacity: 0` and disables pointer events.
- **Panel** – `.ui-overlay-panel` (lines 17-25) uses `transform`, `filter`, and a 0.32s cubic-bezier transition. `.ui-overlay-panel.is-open` (lines 27-31) restores full opacity, scale, and blur. `.ui-overlay-panel.is-closing` (lines 33-37) reduces opacity, shifts, and blurs.
- **View animations** – `.ui-view-enter` (line 39) triggers `ui-view-enter` keyframes (lines 80-90). `.ui-view-fade` (line 43) triggers `ui-view-fade` keyframes (lines 93-101).
- **Tabs & panels** – `.insights-tab` (lines 63-70) and `.insights-panel-enter` (line 76) add subtle transitions.
- **Reduced-motion** – media query (lines 104-120) disables all animations and sets a 0.15s opacity transition for users preferring reduced motion.

Impact

The changes are purely CSS; no JavaScript logic is altered. If the file is omitted from the bundle, the UI will remain static. The reduced-motion media query respects user preferences.

Risks & follow-ups

- **Build inclusion** – verify that `ui-transitions.css` is imported into the component bundle.
- **Smoke test** – confirm overlay open/close and panel animations work as defined.
- **Reduced-motion test** – ensure animations are disabled when the media query matches.
- **Name collisions** – check that keyframe names (`ui-view-enter`, `ui-view-fade`) do not clash with existing animations.
