

tsconfig.json

Kind: added · Baseline: a9c34bfb03fe · Target: NovaDiff · Generated: 2026-05-20T04:10:17.203Z

Overview

A new `tsconfig.json` file (lines 1-25) has been added to the repository. It configures TypeScript for the project with an ES2020 target, ESNEXT module style, and strict linting options.

Key changes

- **compilerOptions** (lines 2-6):
 - `target: "ES2020"`
 - `module: "ESNext"`
 - `useDefineForClassFields: true`
 - `lib: ["ES2020", "DOM", "DOM.Iterable"]`
- **Bundler mode** (lines 9-13):
 - `moduleResolution: "bundler"`
 - `allowImportingTsExtensions: true`
 - `resolveJsonModule: true`
- **Strict type-checking** (lines 18-21):
 - `strict: true`
 - `noUnusedLocals: true`
 - `noUnusedParameters: true`
 - `noFallthroughCasesInSwitch: true`
- **Build flags** (lines 7-15):
 - `noEmit: true`
 - `isolatedModules: true`
 - `jsx: "react-jsx"`
- **Project inclusion** (line 23): includes `src`, `packages/graph-view/src/NovaDiffGraphExplorer.tsx`, and `packages/graph-view/src/index.ts`.
- **Reference** (line 24): points to `tsconfig.node.json`.

Impact

- The compiler will target ES2020 and emit ESNEXT modules, affecting downstream bundling.
- `noEmit: true` means the TypeScript compiler performs only type-checking; emitted JavaScript must come from the bundler.
- Bundler mode flags allow importing `.ts` files and JSON modules directly.
- Strict flags may surface type errors that were previously ignored.

Risks & follow-ups

- Verify that `tsconfig.node.json` exists and contains compatible overrides; missing it will break the build.

- Run the nearest targeted tests and a smoke test for the graph-view components to confirm type-checking passes.
- Ensure the build pipeline respects `noEmit: true` ; adjust if it previously emitted JavaScript.
- Check that the new strict flags do not introduce regressions in legacy code by running linting and unit tests.
