

tsconfig.node.json

Kind: added · Baseline: a9c34bfb03fe · Target: NovaDiff · Generated: 2026-05-20T04:10:52.780Z

Overview

A new `tsconfig.node.json` file (lines 1-11) has been added. It configures TypeScript for a Node-environment build that targets the Vite/Vitest configuration files.

Key changes

- **File added:** `tsconfig.node.json` (lines 1-11).
- **Compiler options** (cited lines R1-R6):
 - `composite: true` – enables incremental builds.
 - `skipLibCheck: true` – skips type checking of declaration files.
 - `module: "ESNext"` and `moduleResolution: "bundler"` – emit ESNext modules and resolve imports using the bundler algorithm.
 - `allowSyntheticDefaultImports: true` – permits default imports from modules without a default export.
 - `types: ["node"]` – includes Node.js type definitions.
- **Include:** only `vite.config.ts` and `vitest.config.ts` are compiled under this config.

Impact

- The config applies to the Vite/Vitest config files, ensuring they compile against Node types.
- `composite: true` allows TypeScript to reuse previous outputs, speeding up subsequent builds.
- `skipLibCheck: true` reduces noise from third-party declaration files, but may hide subtle type mismatches.
- `moduleResolution: "bundler"` changes how imports are resolved compared to classic Node resolution.

Risks & follow-ups

- Verify that the new `tsconfig.node.json` does not conflict with the root `tsconfig.json` or other project-specific configs.
- Run the Vite/Vitest build pipeline to confirm that `moduleResolution: "bundler"` correctly resolves all imports.
- Check that `skipLibCheck: true` does not mask critical type errors in the config files.
- Confirm that incremental builds (`composite: true`) work as expected in CI environments.
